Aryan (ār'i-an or ā'ri-an), *n.* [Skr. *arya*, noble, eminent, probably from *ar*, to plough, from the tribes that follow husbandry being more civilized than purely nomadic races. From the same root we have *Iran*, *Airan*, Persia; *Aryâvarta*, the Vedic name of Hindustan; *Ariovistus*, *Ariobarzanes*, &c. See Max Müller's *Lectures.*] An Indo-European; a member of that division of the human race which includes the Hindus and Persians as its eastern branch, and the Celts, the Greeks and Italians, the Slaves and the Teutons, as its western. 'The parent stock was,' says Max Müller, 'a small clan settled probably on the highest elevation of Central Asia, speaking a language not yet Sanskrit, or Greek, or German, but containing the dialectic germs of all.' This Asiatic origin of the Aryans, however, is not now so generally accepted as formerly, various scholars now asserting Europe to have been their original home. The roots common to the various Aryan tongues show that even in the earliest period the race had made some progress in civilization. The first written notice of Aryans is in the Rig-Veda, 1500 B.C., which describes them as a white race that had come into Hindustan from the north-west. The earliest Aryan colonists of Europe, if they came from Asia, were the Celts, who probably found it a jungle traversed by bands of wandering Finns and Iberians.

Many words still live in India and England that have witnessed the first separation of the northern and southern *Aryans*, and these are witnesses not to be shaken by any cross-examination. The terms for God, for house, for father, mother, son, daughter, for dog and cow, for heart and tears, for axe and tree, identical in all the Indo-European idioms, are like the watchwords of soldiers. We challenge the seeming stranger; and whether he answer with the lips of a Greek, a German, or an Indian, we recognize him as one of ourselves. There was a time when the ancestors of the Celts, the Germans, the Slavonians, the Greeks, and Italians, the Persians and Hindus, were living together beneath the same roof, separate from the ancestors of the Semitic and Turanian races. *Max Müller.*

Aryan (ār'i-an or ā'ri-an), *a.* A term applied to a division of the human family, as well as their speech. See the noun.

In continual struggle with each other, and with Semitic and Turanian races, these *Aryan* nations have become the rulers of history, and it seems to be their mission to link all parts of the world together by the chains of civilization, commerce, and religion. *Max Müller.*

He was called Sheik, and is better known by the denomination of *old man of the mountain*. These barbarous chieftains and their followers spread terror among nations far and near for almost two centuries. The instrument is immersed in a vessel of water, the stem going through a hole in the cover, and distilled water put into the pan, so as to sink the zero of the stem to a level with the cover of the vessel. The water in the pan evaporates, and the stem rises, showing the amount of evaporation in grains.

Graham, master of the mint.

Atmometer (at-mom'et-ėr), *n.* [Gr. *atmos*, vapour, and *metreō*, to measure.] An instrument, invented by Sir John Leslie, to measure the quantity of exhalation from a humid surface in a given time; an evaporometer. It consists of a thin hollow ball of porous earthenware, joined to which is a tube of

glass with divisions. The cavity of the ball and the tube are filled with water, and the top of the tube closed. In this state the instrument is exposed to the free action of the air, when the water transudes through the porous substance, and is evaporated by the air, the extent of evaporation being shown by the sinking of the water in the graduated tube.

Atmosphere (at'mos-fēr), *n.* [Gr. *atmos*, vapour, and *sphaira*, a sphere.] 1. The whole mass of aëriform fluid surrounding the earth, and generally supposed to extend to the height of 40 or 50 miles above its surface. It is a mechanical mixture of 79 volumes nitrogen, with 21 of oxygen, with a trace of carbonic acid gas, and a variable quantity of ozone, aqueous vapour, ammonia, and organic matter. The composition of the atmosphere varies very slightly in different localities. In towns the air usually contains impurities, such as sulphuric acid, hydrochloric acid, &c. These are dissolved in rain-water, which then has in many places an injurious effect on the buildings. The motions of the atmosphere constitute the winds, and in it occur clouds, rain, snow, thunder, and lightning. Its greatest density is at the earth's surface, and the density decreases as the height increases. The atmosphere, like other bodies, gravitates toward the earth, and therefore has weight and pressure. The weight, at an average, at the level of the sea, is found to be about 15 lbs. on the square inch. (See *Atmospheric Pressure*, under ATMOSPHERIC.) If air be condensed so as to exert a pressure of 30 lbs. on the square inch the pressure is said to be *two atmospheres;* a condensation which gives 45 lbs. is termed *three atmospheres;* and so on. Pressures arising from other causes, such as the weight of liquids and the force of steam, are also frequently counted by atmospheres. The atmosphere acts on light, producing the phenomena of refraction, diffraction, reflection, and interference.—2. The gaseous envelope surrounding any other of the heavenly bodies.—3. Any gaseous medium. 'An *atmosphere* of cold oxygen.' *Miller.*—4. *Fig.* pervading influence; as, a moral *atmosphere.*

> By the hearth the children sit,
> Cold in that *atmosphere* of Death. *Tennyson.*

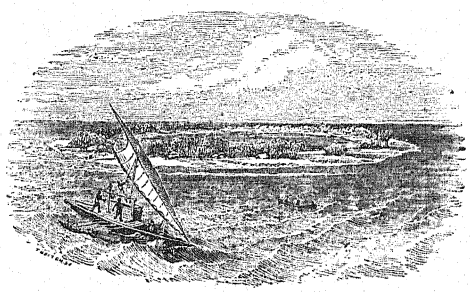
Atmospheric (at-mos-fer'ik), *a.* 1. Pertaining to, existing in, or consisting of the atmosphere; as, *atmospheric* air or vapours. 2. Dependent on the atmosphere.

> I am an *atmospheric* creature. *Pope.*

3. Caused, produced, or operated on by the atmosphere; as, rust, decomposition, or souring is often an *atmospheric* effect.—*Atmospheric churn*, a churn of various forms, in which atmospheric air is driven into the milk in order to agitate it, and also to obtain the specific effect of the air upon the milk in aggregation of the oleaginous globules.—*Atmospheric engine*, a variety of steam-engine, in which the steam is admitted only to the under side of the piston and for the up stroke, the steam being then condensed, and a vacuum thereby created under the piston, which in consequence descends by the pressure of the atmosphere acting on the upper surface of it. Marine engines on this principle have three cylinders connected to one crank-shaft to obtain uniformity of action.—*Atmospheric hammer*, a power-hammer driven by the force of compressed air.—*Atmospheric line* (of a steam-pressure diagram), a line drawn by the pencil when the steam is shut off from the piston of the indicator, and it is acted on by the pressure of the atmosphere alone. The height of the steam-line above this shows the pressure of the steam, and the depth of the vacuum-line below shows the degree of condensation which is then taking place in the engine.—*Atmospheric pressure*, the weight of the atmosphere on a unit of surface, as a square inch. The mean atmospheric pressure referred to this unit is 14·7 lbs. It is also measured by the height of a mercurial column which it supports in a barometer; referred to this measurement the atmospheric pressure is equal to 29·9 inches.—*Atmospheric railway*, a railway so constructed that the motive power is derived from the pressure of the atmosphere acting on a piston working in a continuous iron tube of uniform bore laid from one place to another, the pressure being created by exhausting the air from that end of the tube towards which it is desired the piston should advance, or by forcing in air behind it, or both methods may be employed together. The system has not been found suitable for the ordinary purposes of a railway, though it is successfully worked in some large towns for the conveyance of letters, telegrams, &c., through pneumatic despatch tubes.—*Atmospheric spring*, a spring formed by a confined body of air operating either by means of a cylinder and piston or by an air-tight bag.—*Atmospheric tides*, diurnal oscillations of the atmosphere, produced by the attractions of the sun and moon, similar to the tides of the ocean, indicated by minute variations of pressure on the barometer.

Atmospherical (at-mos-fer'ik-al), *a.* Same as *Atmospheric.*

Atoll (a-tol'), *n.* [Name of such islands in the Maldive group.] A coral island, consisting of a strip or ring of coral surrounding a central lagoon. Such islands



Atoll.

are very common in the Pacific Ocean. They present often an exceedingly picturesque appearance: a comparatively narrow strip of coral rock thinly coated with soil, and covered with a vigorous growth of cocoa-nut, pandanus, and bread-fruit trees, inclosing a large still sheet of water, usually of considerable depth, and often well supplied with fish. The circle of coral is sometimes complete, showing no apparent communication between the inclosed lagoon and the surrounding sea; but generally it is interrupted, and presents one or more openings, frequently of sufficient extent and depth to be used as a boat-passage. Atolls are produced by a coral reef being formed in the shallow water surrounding an islet which is in course of becoming slowly submerged, the encircling reef continuing to grow steadily upwards as the peak of land which it at first surrounded continues to descend.

Atom (at'om), *n.* [L. *atomus*, Gr. *atomos*, an atom, properly an adjective signifying uncut, indivisible—*a*, not, and *temnō*, to cut.] 1. An extremely minute particle of matter; a term used generally with certain philosophic or scientific limitations. (*a*) A particle of matter so minute as to admit of no division; an ultimate indivisible particle of matter. Such particles have been conceived by some to be the first principles or ultimate component parts of all bodies. (*b*) An ultimate particle of matter, without regard as to whether it is divisible or indivisible; a molecule. (*c*) In *chem.* a hypothetical particle of matter—the smallest quantity of an element which can enter into chemical combination—having a definite weight, magnitude, and form, alike for the atoms of the same material, and indivisible by chemical force. (*d*) In *physics*, the smallest particle of any kind of matter which can exhibit the properties of that matter: the atom of the physicist is synonymous with the molecule, while the molecule of the chemist—that is, the smallest part of a substance which can exist in a free state—contains two or more atoms. Hence—2. Anything extremely small; a minute quantity; as, he hasn't an *atom* of sense.

Atom † (at'om), *v.t.* To reduce to atoms; to atomize. 'And *atom'd* mists, turn instantly to hail.' *Drayton.*

> Being *atomic* not be dissoluble,
> Not follow the great law? *Tennyson.*

2. Extremely minute.—*Atomic philosophy*, a system of philosophy developed by Democritus and Epicurus, which teaches that atoms are endued with gravity and motion, and that by these atoms all things were formed without the aid of a Supreme intelligent Being.—*Atomic theory*, or *doctrine of definite proportions*, in *chem.* the hypothesis which teaches that all chemical combinations take place between the ultimate particles or atoms of bodies, and that these unite either atom with atom, or in proportions expressed by some simple multiple of the number of atoms.—*Atomic weights*, in *chem.* the numbers expressing the proportions in which bodies unite, and which must, according to the atomic theory, likewise indicate the relative weights of atoms. In constructing a table of atomic weights hydrogen is taken as the unit; the atomic weights of the other elements therefore express how many times the atoms of these elements are heavier than the atom of hydrogen.—*Atomic volume*, in *chem.* the space occupied by a quantity of a body proportional to its atomic weight, and expressed by the quotient of the atomic weight divided by its specific gravity. This represents the relation by volume in which substances combine as elementary or compound gases.—*Atomic* or *molecular heats of bodies*, the product of the specific heats of bodies into their atomic weights. These products are nearly the same for all elementary bodies, and in compounds of like atomic composition the specific heats are inversely as the atomic weights, though the products of the specific heats into the atomic weights may differ in different classes of compounds.

Wedgwood considers *attire* another form of Fr. *atour*, dress, ornaments, the words *attour, atour*, and *attire* being sometimes used in O.E. with apparent indifference; but this seems unlikely. And will have no *attorney* but myself. *Shak.*

Specifically, in *law*, one who is appointed or admitted in the place of another to transact any business for him. An attorney may be either *private* or *public.* A *private attorney* or *attorney in fact*, is one authorized to make contracts and do other acts for his principal, out of court, for which purpose a verbal authority is in general sufficient; but for the performance of some acts, as to deliver seisin of land, to transfer bank stock, &c., a formal power of attorney is neces-

sary. A *public attorney* or *attorney at law* is a person qualified to appear for another before a court of law to prosecute or defend any action on behalf of his client. The term was formerly applied especially to those practising before the supreme courts of common law at Westminster, and corresponded to the term *solicitor* used in regard to the Courts of Chancery. As an attorney was almost invariably a solicitor, the two terms came to be generally regarded as synonymous. By the Judicature Act of 1873 all persons practising before the supreme law courts in London are now called solicitors, and the term *attorney* is out of use. Solicitors do not plead or argue in court on behalf of their clients, this being the part of the barristers or counsel; their special functions are to institute and defend actions on behalf of their clients, to furnish counsel with the necessary materials to enable them to get up their pleadings, to practise conveyancing, to prepare legal deeds and instruments of all kinds, and generally to advise with and act for their clients in all matters connected with law. In Scotland no class of practitioners of the law have ever taken the name of *attorneys*, but *writer* and *solicitor* are equivalents. In America the full title of a properly qualified lawyer is *attorney and counsellor-at-law*, and there is no separate class known as barristers or advocates. —2. By attraction every body tends to the earth, and if raised from its surface falls to it again. The plumb-line, which is usually vertical, is deflected in the vicinity of a large mountain by the attraction of the mass. The moon is constantly drawn towards the earth; the earth and the other planets towards the sun. Attraction is exhibited in various ways, which has led to the use of various specific designations. When bodies tend to come together from sensible distances, that tendency is called either the attraction of *gravitation, magnetism*, or *electricity*, according to circumstances; when the surfaces of bodies in contact tend together, it is by *adhesion;* when the particles of the same body tend together, it is by *cohesion;* and when the particles of different bodies in contact tend together it is by *affinity;* the tendency of fluids to rise in fine tubes or in small interstices of porous bodies is called *capillary* attraction. See CAPILLARY, CHEMICAL, COHESION, ELECTRICITY, GRAVITATION, MAGNETISM. Sometimes it appears in detached places; at other times it almost covers the whole sky. As the streams of light have a tremulous motion they are called in many places 'the merry dancers.' They assume many shapes and

a variety of colours, from a pale red or yellow to a deep red or blood colour; and in the northern latitudes serve to illuminate the earth and cheer the gloom of long winter nights. The appearance of the aurora borealis so exactly resembles the effects of artificial electricity that there is every reason to believe that their causes are identical. When electricity passes through rarefied air it exhibits a diffused luminous stream which has all the characteristic appearances of the aurora, and hence it is highly probable that this natural phenomenon is occasioned by the passage of electricity through the upper regions of the atmosphere. The influence of the aurora upon the magnetic needle is now considered as an ascertained fact, and the connection between it and magnetism is further evident from the fact that the beams or coruscations issuing from a point in the horizon west of north are frequently observed to run in the magnetic meridian. At the same time, a luminous arch is occasionally seen stretching across the heavens, and crossing the magnetic meridian at right angles. The aurora borealis is said to be frequently accompanied by sound, which is variously described as resembling the rustling of pieces of silk against each other, or the sound of wind against the flame of a candle.—*Aurora australis*, the aurora of the southern hemisphere, quite a similar phenomenon to that of the north.—*Aurora polaris*, polar aurora; the aurora of either the northern or the southern hemisphere.

(See STETHOSCOPE.) Average (av'ėr-āj), *n.* [There seem to be two words in English with this form. The present is to be referred to Fr. *avarie*, It. and Pg. *avaria*, Sp. *averia*, D. *haverij*, G. *havarie, havarei, haverei, haferei*, Dan. *haveri*, damage sustained by goods at sea, average in the commercial sense, though its terminal syllable appears to have been borrowed from the other word treated in a succeeding article. *Avarie, havarie*, &c., have been sometimes derived from the Teut. *haven* or *haf*, the sea, but the term seems rather to have originated on the shores of the Mediterranean, and to be derived (as Dozy and Wedgwood think) from Ar. *awār, awār*, defect, flaw. Skeat thinks, however, that the L.L. *averagium* (see AVERAGE below) is sufficient to explain all the meanings, signifying originally the carriage of goods by *averia* or draught-cattle, then a charge for carriage, and lastly a contribution towards loss of things carried.] 1. In *com.* and *maritime law*, (*a*) a contribution falling to be made by the owners of a ship's freight and cargo, in proportion to their several interests, to make good a loss that has been sustained or an expense incurred for the general safety of the ship and cargo. Thus, when for the safety of a ship in distress any destruction of property is incurred, either by cutting away the masts, throwing goods overboard, or other means, all persons who have goods on board or property in the ship (or the insurers) contribute to the loss according to their average, that is, according to the proportionate value of the goods of each on board. Called also, and more specifically, *General Average.* (*b*) A loss or the sum paid on account of a loss (such as that of an anchor) when the general safety is not in question, and which falls on the owner of the particular property lost. Called more specifically *Particular Average.* (*c*) A small charge paid by the master on account of the ship and cargo, such as pilotage, towage, &c. Called more specifically *Petty Average.* (*d*) A small duty payable by the shippers of goods to the master of the ship, over and above the freight, for his care of the goods. Hence the expression in bills of lading, 'paying so much freight, with primage and *average* accustomed.'—2. A sum or quantity, intermediate to a number of different sums or quantities; a mean proportion; thus, if four persons lose respectively £2, £5, £10, and £15, the *average* loss by the four is £8. Hence—3. Any medial amount, estimate, or general statement based on a comparison of a number of diverse specific cases; a medium. 'The *average* of sensations.' *Paley.*—*Upon* or *on an average*, taking the mean of several unequal numbers or quantities; taking the mean deduced from a great number of examples.

Aves (ā'vēz), *n. pl.* [L., birds.] The fourth class of vertebrates, consisting of animals which breathe by lungs, have warm, red blood and a double circulation; are produced from eggs; covered with feathers; have a prominent, naked, toothless bill; and four limbs, the two anterior being organized for flight, and called wings. The bones are hollow, marrowless, and receive air from the lungs. Owing to the extreme compactness and homogeneity of the entire class, conditioned mainly by their aerial mode of life, the subject of their classification has been one of the greatest difficulties of the systematic naturalist. Linnæus and Cuvier divided them into six orders, those of the latter being Palmipedes, Grallæ, Accipitres, Gallinaceæ, Passeres, and Scansores. The classification generally adopted is that originally proposed by Kirby, with the addition of Huxley's order Saururæ—namely, Natatores or swimmers, Grallatores or waders, Cursores or runners, Rasores or scratchers, Scansores or climbers, Insessores or perchers, Raptores or birds of prey, and the Saururæ, including only a single member—namely, the extinct lizard-tailed Archæopteryx. These divisions are founded chiefly on the beak and feet, and the families and genera, into which the several orders are divided, chiefly on the beak. The classification which approaches most nearly a strictly natural one is that of Professor Huxley, who divides the birds into the following three orders:—Saururæ, consisting of the single member Archæopteryx; Ratitæ, comprising the running birds that cannot fly, as the ostriches, emus, and cassowaries, whose chief characteristic is that the sternum is raft-shaped, having no median ridge or keel for the attachment of the great pectoral muscles; and Carinatæ, comprising all the living flying birds, characterized by the fact that the sternum is furnished with a prominent median ridge or keel.

[*Avocation* means the being called away from something. We might say, 'He could not do it, having *avocations* elsewhere.' But in our newspapers *avocation* means a man's calling in life. This use of *avocation* for 'vocation,' however common, has seldom had the sanction of good writers. . . . Lord Lytton, in using it, stands pretty nearly alone, I suspect, among very recent writers of any celebrity. . . . On the other hand (the plural) was long ago used, sometimes to denote 'pursuits,' 'duties,' and such is, I think, almost exclusively, its modern import. *Fitzedward Hall.*]

Axiom (aks'i-om), *n.* [Gr. *axiōma*, authority, an authoritative sentence, or that which is assumed, from *axios*, worthy, *axioō*, to think worthy, to esteem.] 1. A self-evident truth or proposition; a necessary truth; a proposition whose truth is so evident at first sight that no process of reasoning or demonstration can make it plainer; as, 'the whole is greater than the part;' 'things which are equal to the same thing are equal to one another;' 'it is impossible for a thing both to be and not to be at the same time;' 'from nothing, nothing can arise.' All common notions of the mind, whose evidence is so clear and forcible that a man cannot deny them without renouncing common sense and natural reason, may be called axioms.

2. An established principle in some art or science; a principle universally received; as, the *axioms* of political economy.—*Axioms, Postulate. Axiom*, a self-evident truth, existing in the very nature of things, and hence not admitting of denial. *Postulate*, something required to be granted as a basis for reasoning. Such a basis may be self-evident and therefore axiomatic, or it may be agreed on between two reasoners and admitted by both, but not as a proposition which it would be impossible to deny.—*Aphorism, Axiom, Maxim, Apophthegm, Adage, Proverb, Byword, Saw.* See under APHORISM.

The straight line, real or imaginary, passing through a body or magnitude, on which it revolves, or may be supposed to revolve, especially such a straight line with regard to which the different parts of a magnitude, or several magnitudes, are symmetrically arranged; as, the *axis* of the earth or any sphere; the *axis* of a cone; the *axis* of a curve; the *axis* of a system of magnitudes. [In this sense the word is chiefly a term of mathematical and physical science, and the most important applications of it are explained below in the various connections in which it is employed.]—2. In *bot.* the central line or column about which other parts are arranged; especially the root and stem of the whole plant, being the central part or column around which the other parts are disposed, divided into the *ascending axis* or stem, and the *descending axis* or root, which two are united by the *collum* or neck.—3. In *anat.* (*a*) the second vertebra of the neck. It has a tooth-like process which passes upward through the central foramen of the first vertebra or atlas, thus serving as a pivot on which the latter turns; hence, (*b*) the tooth-like process itself.—*Anticlinal axis*, in *geol.* see under ANTICLINAL.—*Axis in peritrochio*, an old Latin term for the wheel and axle. See under WHEEL.—*Axis of a beam of light*, the middle ray of the beam.—*Axis of a cone*, a straight line drawn from the vertex to the centre of the base.—*Axis of a curve*, a right line dividing it into two symmetrical parts, so that the part on one side exactly corresponds to that on the other, as in a parabola, ellipse, or hyperbola.—*Axis of a cylinder*, the line drawn from the centre of the one end to that of the other.—*Axis of a lens*, a straight line drawn through the optical centre of the lens, and perpendicular to both its surfaces.—*Axis of a magnet*, the imaginary line which connects the north and south poles of the magnet.—*Axis of a sphere*, any line drawn through the centre and terminated both ways by the surface of the sphere.—*Axis of a spherical, concave*, or *convex mirror*, a straight line which passes through the geometrical and optical centres of the mirror.—*Axis of a telescope*, a straight line passing through the centres of all the glasses in the tube.—*Axis of oscillation of a pendulum*, a right line passing through the centre, about which it vibrates, and perpendicular to the plane of vibration.—*Axis of refraction*, the straight line drawn perpendicular to the surface of the refracting medium, through the point of incidence of the refracted ray. Some crystals have two axes of refraction.—*Axis of revolution*, the axis about which a revolving body moves.—*Axis of rotation*, the axis about which all the parts of a rotating body turn. The axis of rotation is in the body itself: the axis of revolution is at the centre of the circle or other curve in which the body is moving. These terms are exemplified by the motions of the earth, which rotates on its own axis, and revolves about a line passing through the sun's centre, perpendicularly to the orbit in which it moves.—*Axis of symmetry*, a line on both or all sides of which the parts of a body or magnitude are symmetrically disposed.—*Axis of the earth*, the line connecting its two poles, and about which the earth performs its diurnal rotation.—*Axis of the eye*, a straight line passing through the centres of the pupil and crystalline lens.—*Axis of the Ionic capital*, a line passing perpendicularly through the middle of the eye of the volute.—*Axis of the world*, the imaginary axis passing through the celestial poles.—*Spiral axis*, in *arch.* the axis of a twisted column spirally drawn in order to trace the circumvolutions without.—*Transverse axis*, and *conjugate axis.* See TRANSVERSE and CONJUGATE.—*Visual* or *optic axis*, in *optics*, the straight line passing through the centre of the pupil, and perpendicular to the surface of the eye.

The word is a diminutive corresponding to O.H.G. *ahsala* (Mod. G. *achsel*), the shoulder, from *ahsa* (Mod. G. *achse*), an axis. The meaning *shoulder* is explained by the fact that the arm turns on the shoulder-joint. This meaning has been lost in English probably from the influence of L. *axis*, O.Fr. *aissel* (L. *axiculus*), an axis. The L. *axis* is not the origin of E. *axle*, but an independent form from the same root, viz. *ag*, to drive. See ACRE.] A piece of timber or bar of iron, fitted for insertion in the hobs or naves of wheels, on which the wheels turn.—*Driving axle*, in *locomotive engines*, the axle which, by means of connecting-rods and eccentric-rods, is connected with the piston, slide-valves, and pumps, and by converting the rectilinear motion of the piston into a rotary one, propels or drives the engine in the required direction.

B.

B is the second letter and the first consonant in the English and most other alphabets. It is a mute and labial, pronounced solely by the lips, and is distinguished from *p* by being sonant, that is, produced by the utterance of voice as distinguished from breath. It is related to the sonant aspirate *v* as *p* to the surd aspirate *f*. According to Grimm's law, when words or roots are common to the Indo-European languages (or several of them), and, where borrowing has not taken place, in English, Gothic, and the Low German and Scandinavian languages generally, a *b* regularly stands where there is an *f* in Latin words, a *ph* in Greek, a *bh* in Sanskrit, while in O.H. German and Mod. German words it is either unchanged, or a *p* takes its place. All these changes are illustrated by the various forms which the English word *brother* assumes in the different languages. Thus we have E. *brother*, Goth. *brothar*, O.H.G. *pruodar*, Mod. G. *bruder*, L. *frater*, Gr. *phratēr*, and Skr. *bhratar*. Similarly, E. to *bear*, Goth. *baira*, O.H.G. *piru*, Mod.G. ge-*bären*, L. *fero*, Gr. *pherō*; E. *beech*, G. *buche*, L. *fagus*, Gr. *phēgos*. B has intruded into some English words, as in *thumb* (A. Sax. *thuma*), *limb* (A. Sax. *lim*), *slumber* (A. Sax. *slumerian*); comp. the borrowed words *number* (L. *numerus*), *humble* (L. *humilis*). When a final letter after *m* it is not pronounced, as in *thumb*, *limb*, *comb*, *dumb*. In *gossip*, *purse*, a *b* has been changed into a *p*. On the other hand the *b* in *lobster*, and the first in *cobweb*, was originally *p*; in *marble* the *b* was originally *m* (L. *marmor*). B is common as an initial consonant in all the Teutonic languages, and very often in the combinations *bl*, *br*, which are the only consonantal combinations it admits of at the beginning of words. In this respect there is a remarkable difference between *b* and *p*, the latter occurring as an initial in but few words originally Teutonic. See P.—As a numeral B was used by the Hebrews and Greeks, as now by the Arabians, for 2; by the Romans for 300, and with a dash over it thus, $\overline{B}$, for 3000.—B is often used as an abbreviation; thus B.A. stands for *Bachelor of Arts;* B.D. for *Bachelor of Divinity;* and B.M. for *Bachelor of Medicine.—Not to know a B from a bull's foot*, a phrase implying that a person is very illiterate or very ignorant. The term *bull's foot* seems to be chosen merely for the alliteration, as *broomstick* and *battledore* in the similar phrases, He does not know a *B* from a *broomstick*, or from a *battledore*.

B. In *music*, the seventh note of the model diatonic scale or scale of C. It is called the leading note, as there is always a feeling of suspense when it is sounded until the key-note is heard.

Baal (bā'al), *n.* [Heb. *ba'al*, lord.] Originally this word appears to have been generic, signifying simply lord, and to have been applied to many different divinities, or, with qualifying epithets, subjoined to the same divinity regarded in different aspects and as exercising different functions. Thus in Hos. ii. 16 it is applied to Jehovah himself, while *Baal-berith* (the Covenant-lord) was the god of the Shechemites, and *Baal-zebub* (the Fly-god) the idol of the Philistines at Ekron. Specifically, Baal was the sacred title applied to the Sun as the principal male deity of the Phœnicians and their descendants the Carthaginians, as well as of the ancient Canaanitish nations, whom they worshipped as the supreme ruler and vivifier of nature. The word enters into the composition of many Hebrew, Phœnician, and Carthaginian names of persons and places; thus, *Jerubaal*, *Hasdrubal* (help of Baal), *Hannibal* (grace of Baal), and *Baal-Hammon*, *Baal-Thamar*, &c.

Old English Bagpipe.

Scotland, especially Celtic Scotland, it is only Scottish by adoption, being introduced into that country from England. The earliest notice of it in Scotland is in the royal treasurer's accounts in the reign of James IV., wherein are frequent entries of monies paid '*to Inglis pyparis*,' who came to play before the king, who had brought the taste with him from England. Chaucer's miller could well play the bagpipe, and in Shakspere's days a 'Yorkshire bagpipe' and the 'drone of a Lincolnshire pipe' were familiar. The bagpipe consists of a leathern bag, which receives the air from the mouth, or from bellows; and of pipes, into which the air is pressed from the bag by the performer's elbow. One pipe (called the *chanter*) plays the melody, others (called *drones*) sound respectively the key-note (an octave lower) and the fifth of the scale, the sound being produced by means of reeds. The chanter has eight holes, which the performer stops and opens at pleasure. There are several species of bagpipes, as the soft and melodious Irish bagpipe, the more martial Highland bagpipe, the old English bagpipe (now no longer used), the Italian bagpipe, &c.

The progressive steps by which L. *bajulare* became Fr. *bailler* are thus given by Brachet: *bajulare, baj'lare, bailare, bailler.*] 1.† To deliver; to release.

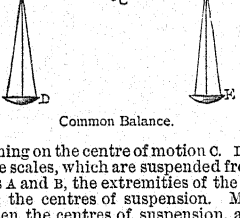
In all criminal cases except treason two justices may admit a person to bail, and in all cases of misdemeanour except those enumerated in 11 and 12 Vict. cap. xlii. sec. 23, they are bound to do so; but in cases of treason a person cannot be admitted to bail except by order of a secretary of state, or by the Queen's Bench division of the High Court of Justice, or a judge thereof in vacation. By the law of Scotland an accused person is entitled to be liberated on bail, of a fixed amount according to the rank of the person accused, provided the crime charged against him is not one for which capital punishment may be inflicted, or one for which it might be inflicted before the passing of the act 2 and 3 Will. IV. cxxiii. In these cases the Court of Justiciary or the lord-advocate may consent to bail being taken, but they are not bound to do so, and they may fix the amount of bail at their own discretion. In civil cases there are several kinds of bail at common law, the chief being *common bail* and *special bail*. *Common bail*, or *bail below*, which is now disused, was given to the sheriff on a bail bond entered into by two persons, on condition that the defendant appear at the day and in such place as the arresting process commands. *Special bail*, *bail above*, or *bail to the action*, is given by persons who undertake generally, after appearance of a defendant, that if he be condemned in the action he shall satisfy the debt, costs, and damages, or render himself to the proper person, or that they will do so for him. *Wharton.* In Scotland bail in civil cases is called *caution* (which see).—3. Balance (bal'ans), *n.* [Fr., from L. *bilanx,* an implement for weighing composed of two scales or dishes suspended from a beam—*bis,* twice or double, and *lanx,* a dish, the scale of a balance.] 1. An instrument for ascertaining the weight of bodies. In its original and simplest form it consists of a beam or lever suspended exactly in the middle on a pivot near its centre of gravity, with a scale or basin hung to each extremity of precisely equal weight. The annexed figure represents the common balance. A B is the beam, which rests in a horizontal position, and is capable



Common Balance.

of turning on the centre of motion C. D and E are the scales, which are suspended from the points A and B, the extremities of the beam, called the centres of suspension. Midway between the centres of suspension, and directly above the centre of motion, there rises from the upper surface of the beam a perpendicular slender stem called the *tongue,* which, when the beam is horizontal, points to the top of the handle F, by which the whole is suspended. In a properly constructed balance the beam should rest in a horizontal position when the scales are either empty or loaded with equal weights; a very small addition of weight put into either scale should cause the beam to deviate from the horizontal position; and the arms of the beam should be inflexible, exactly similar, equal in weight and length. Other things being equal, the greater the length of the arms the greater will be the sensibility of the balance or its tendency to deviate with a slight addition to either scale. The centres of suspension of the scales and the centre of gravity of the beam should be all in one straight line, and the centre of motion should be a little above the centre of gravity. The centre of motion and the centre of suspension should cause as little friction as possible.—*Alloy balance,* a balance for weighing metals which are to be combined in decimal proportions, for example, 17 of tin and 83 of copper. In Robert's alloy balance the point of suspension is movable, and is adjusted to the point at which the arms of the balance bear to one another the proportion of the metals to be weighed, in this case 17 to 83. The beam of the balance is then brought to the position of equilibrium by means of a weight suspended from a continuation of the short arm of the balance, and when the balance is so adjusted any quantity of copper put in the short-arm scale will be balanced by the requisite proportion of tin in the other scale, that is, 17 per cent. of the total weight of the two. —*Assay balance,* one used in docimastic operations for weighing minute bodies. Such balances, besides being made with extraordinary care, are always placed under glass cases to protect them from currents of air.—*Torsion Balance.* See under TORSION. —*Bent-lever balance,* a weighing scale in which the scale-pan is attached to the short arm of a bent-lever, the long arm indicating the weight in the pan by traversing a graduated arc.—*Electric balance.* Same as *Balance-electrometer* (which see).—*False balance,* a balance constructed for fraudulent purposes, having the arms of unequal lengths but of equal weights. When the scales are empty the beam rests in a horizontal position, and the balance appears to be just; but when a weight is put into the scale suspended from the short arm a less weight of goods put into the other scale will be sufficient to cause the beam to settle in a horizontal position and produce an apparent equilibrium. The readiest way of detecting such a balance is to make the weight and the article weighed to change places, for then the scale suspended from the longer arm will immediately preponderate.—*Hydrostatic balance.* See under HYDROSTATIC.—*Roman balance,* a steelyard (which see).—*Spring-balance.* See SPRING-BALANCE.—2. *Fig.* the act of mentally comparing or estimating two things, as by a balance. 'Upon a fair *balance* of the advantages on either side.' *Atterbury.*—3. † Weight. *Holland.*—4. Hence, in accounts, the difference of two sums; as, upon an adjustment of accounts a *balance* was found against A in favour of B.—*To pay a balance,* to pay the difference and make the two accounts equal.—5. An equality of weight, power, advantage, and the like; equipoise or just proportion, as of emotions and the like; as, *balance* of power, force, mind, &c.; to lose one's *balance.*

In *astron.* a sign in the zodiac, called in Latin Libra, which the sun enters at the equinox in September.—*Balance of power,* in *politics,* a certain equality of power among a number of different states; or more specifically, such an equality among the most powerful of a number of states, along with a disposition to maintain their relative

power. When a few of the leading powers of a number of separate and sovereign states counterpoise each other the balance of power is maintained, and the safety of the smaller states secured. The leading rule by which this has been effected in Europe has been to oppose every new arrangement which threatens either materially to augment the strength of one of the greater powers or to diminish that of another.—*Balance of trade*, a phrase used to denote the relation in respect of amount or value which subsists between the exportation of domestic productions from a country and the importation of foreign; or the difference between the amount or value of the commodities exported and imported. Hence the expression, formerly much more common than now, The *balance* of trade is against or in favour of a country. Formerly this subject was not well understood, but properly speaking, there cannot be any such thing as a balance of trade for or against a country.

A scale-pan *d* is suspended from one arm, and just rests upon the support E, likewise insulated and fixed upon the stand A. From the other arm is suspended a light gilt cone *a*, the base of which is opposed to the base of another inverted cone *b*, which may be fixed at any distance from it by sliding upon the insulated pillar *d′*. One of the two great military engines used by the ancients for discharging missiles, especially against a besieged place, and often confounded with the catapult used for throwing darts, while the ballista threw stones. In principle it resembled the mediæval arbalist or cross-bow, but was much stronger, ballistæ being mentioned that threw stones of 3 cwts. They were worked by machinery, as by lever and axle. The cord was of hair. After the time of Julius Cæsar the term appears to have been applied in a loose way to any large engine for throwing missiles.—2. A piece of ordnance is fired against a cast-iron case filled with bags of sand, which forms the ball of a pendulum, and the percussion causes the pendulum to vibrate. The arc through which it vibrates is measured on a copper arc by an index carrying a vernier, and the amount of vibration forms a measure of the force or velocity of the ball. The ballistic pendulum is now nearly superseded by Navez' *electro-ballistic apparatus.* See ELECTRO-BALLISTIC, EPROUVETTE.

A net-work of twine envelops the balloon, and is tied to a circular hoop a little below the body of the balloon, from which a car, usually consisting of a large wicker basket and bearing the aëronaut or others, is suspended. A valve in the bottom of the balloon can be opened or closed at pleasure by means of a string, and the basket is furnished with sand-bags as ballast. If the aëronaut wishes to ascend he throws out some of the ballast; if to descend he opens the valve. Balloons have been successfully used for military purposes (see *Captive Balloon*, below), and, in the case of besieged cities, as a medium of communication with the outside world (see *Steering Balloon*, below). The greatest height yet attained in a balloon was 7 miles by Messrs. Glaisher and Coxwell in 1862.—*Captive balloon*, a balloon attached to some particular place by means of a rope, which may be either permanently fixed or connected with an anchor which can be raised at pleasure. Such balloons are employed for military reconnaissance, or for dropping missiles, as nitro-glycerine bombs, upon forts or any other place to be assailed.—*Steering balloon*, a balloon capable of being steered. One such was invented by M. Dupuy de Lôme during the siege of Paris in 1871. The rudder was said to be able to deflect the machine 11° to either side of the direct line in which the wind was blowing. Other so-called steering or navigable balloons have since been made, but none seems to have been quite successful.

In such statutory elections the mode of voting is by voting papers, and not by balls. In clubs, scientific societies, &c., the members are almost universally elected by ballot, a black and a white ball being often employed, the former signifying rejection; hence the expression to *black-ball*, signifying to reject a candidate.—4. A balsam is thus intermediate between a volatile oil and a resin. It is soluble in alcohol and ether, and capable of yielding benzoic acid. From the creeping underground rhizome, which is long, thick, and jointed, spring the round jointed stems, which send out from their joints panicles of flowers, and footstalks bearing the leaves. The stems are also armed at their joints with one or two sharp rigid spines. The leaves are usually 8 or 9 inches long. Some stems grow to 8 or 9 inches in diameter, reaching the height of 100 or more feet, and are so hard and durable as to be used for building. The smaller stems are also useful, and indeed the plant serves innumerable purposes in the East Indies, China, and other eastern countries, the West Indies, tropical America, &c. Cottages are almost wholly made of it; also bridges, water-pipes, ladders, fences, furniture, boxes, baskets, mats, paper, masts for boats, &c. Furniture and other articles made of bamboo are now familiar in Europe. It grows for twenty-five or more years before it produces seed, which is sometimes used as rice, while the young shoots are made into pickles. The pith is saccharine. There are several other well-known and useful species, as *B. spinosa*, common about

Grimm connects this word with Goth. *bandva*, a sign, whence *bandvjan*, to beckon, to make a sign. From the sense of sign, indication, the transition is easy to that of proclamation, edict. The meanings interdiction, proscription, penalty, curse, are from *ban* in its secondary sense of a summons to the banner of the empire, these senses flowing from the punishments denounced against such as neglected the call. From this stem came *abandon*, *banner*, *bandit*, *banish*, &c.] 1. Notice of a marriage proclaimed in a church: generally used in the plural *banns* (which see).—2. Interdiction; prohibition. This is the origin according to Max Müller, who derives the word in the meaning of goose from *Hibernia*, Ireland, supposing that the barnacle geese were originally called *hiberniculæ*, or Irish geese, and that the similarity in the names gave rise to the extraordinary belief regarding the origin of these birds. (See below.) As the name of a kind of shell-fish, however, the word may be from the Celtic rather than the Latin; comp. Fr. *branache*, *brenache*, *barnache*, Gael. *bairneach*, barnacles, limpets; W. *brenig*, limpets; Manx *barnagh*, a limpet.] 1. A stalked cirriped, genus Lepas, family Lepadidæ, often found on the bottoms of ships, on pieces of timber, floating in or fixed below the surface of the sea; the goose-mussel. This belief may have arisen from some fancied resemblance of the cirripeds of the same name to birds; somewhat in the same way as the plant columbine has received its name. Barometer (ba-rom'et-ėr), *n.* [Gr. *baros*, weight, and *metron*, measure.] An instrument for measuring the weight or pressure of the atmosphere. The simplest instrument of this kind consists of a glass tube, about 33 inches long, hermetically sealed at one end, and then filled up with pure mercury, after which it is placed perpendicularly with the open end dipping into a cup or cistern containing pure mercury. On the tube being inverted the column of mercury sinks a little, leaving a vacuum at the top till the pressure of the atmosphere on the surface of the mercury in the cup equals the weight of the column in the tube and supports it. When the atmosphere is dense its pressure is greater and the mercury is forced higher, whereas when it is rarer and consequently lighter, the mercury falls, thus indicating by its risings and fallings the varying pressure of the air. The mean height of

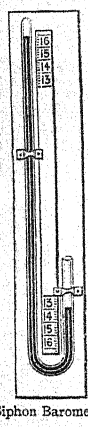
the barometer at sea-level is 30 inches. This instrument was invented by Torricelli, of Florence, in 1643. A water-barometer might be constructed exactly in the same manner, only in this case the column would be about 34 feet in height, water being so much lighter than mercury. The most common applications of the barometer are to indicate changes of weather and to determine the altitude of mountains, by the falling and rising of the mercury (the mercury falling the higher the barometer is carried, and consequently the less the pressure of the air). In order to show the exact extent of these variations the tube is connected with a graduated scale, so that small movements in the column are observable. There are several varieties of the barometer, of which the two kinds most in use as a weather-glass are the common upright barometer and the wheel barometer. The upright barometer (described above in its simplest form) is, when properly constructed, the most accurate of all barometers. The wheel barometer belongs to the class of



Siphon Barometer.

siphon barometers, one of which is shown in the adjoining cut. The siphon barometer consists of a bent tube, generally of uniform bore, having two unequal legs. The longer leg, which must be more than 30 inches long, is closed, while the shorter leg is open. A sufficient quantity of mercury having been introduced to fill the longer leg, the instrument is set upright, and the mercury takes such a position that the difference of the levels in the two legs represents the pressure of the atmosphere. In the best siphon barometers there are two scales, one for each leg, the divisions on one being reckoned upwards, and on the other downwards from an intermediate zero point, so that the sum of the two readings is the difference of levels of the mercury in the two branches. The wheel barometer is far from being accurate, but it is often preferred for ordinary use on account of the greater range of its scale, by which small differences in the height of the column of mercury are more easily observed. It usually consists of a siphon barometer, having a float resting on the surface of the mercury in the open branch, a thread attached to the float passing over a pulley, and having a weight as a counterpoise to the float at its extremity. As the mercury rises and falls the thread turns the pulley which moves the index of the dial. A rack and pinion may be substituted for the thread as in the cut. The marine barometer is suspended in gimbals, and is usually contracted at the bottom to prevent rapid oscillations of the mercury. The mountain barometer is a portable mercurial barometer with a tripod support and a long scale for measuring the altitude of mountains. To prevent breakage, through the oscillations of such a heavy liquid as mercury, it is usually carried inverted, or it is furnished with a movable basin and a screw, by means of which the mercury may be forced up to the top of the column.—*Aneroid Barometer.* See under ANEROID. *Barometer gauge,* an apparatus attached to the boiler of a steam-engine or other chamber in which a more or less perfect vacuum is liable to be formed, to indicate the state of the vacuum. A common form is a bent tube with one end plunged in a basin of mercury, and the other end connected with the vacuum chamber.

Baron (bar'on), *n.* [Fr. *baron,* O.Fr. *ber, bers* (*baron* in the acc.), Pr. *bar* (*baron* in acc.), It. *barone,* Sp. *varon.* The origin of the word is doubtful. Its earliest meanings are such as strong man, bold man, warrior, husband, nobleman, and the derivation from O.H.G. *bar,* a man, from *beran,* Goth. *bairan,* E. to *bear,* seems as probable as any, whether the notion originally attaching to the word was that of one who could *bear,* as being strong and robust, or one who was *born,* a human being; comp. A. Sax. *beorn,* a prince, which appears certainly to be from *beran,* to bear, to produce. These German etymologies Littré remarks, without being completely certain, are probable, though it is probable also that the Celt. (O.Cym.) *bar,* a hero, and perhaps (Gael.) *fear,* a man, have united in confirming and giving precision to the sense of the Germanic word in the Romance languages.] 1. In Great Britain, a title or degree of nobility; one who holds the lowest rank in the peerage; as, *Baron* (or Lord) Auckland; *Baron* Arundell of Wardour. The children of barons have the title of 'Honourable.' Originally the barons, being the feudatories of princes, were the proprietors of land held by honourable service. Hence in ancient records the word barons comprehends all the nobility. All such in England had in early times a right to sit in parliament. Anciently barons were *greater,* or such as held their lands of the king *in capite;* or *lesser,* such as held their lands of the greater barons by military service *in capite.* 'The present barons are—(1) *By prescription;* for that they and their ancestors have immemorially sat in the Upper House. (2) *Barons by patent,* having obtained a patent of this dignity to them and their heirs male, or otherwise. (3) *Barons by tenure,* holding the title as annexed to land.' *Wharton.* Formerly, when all barons were not summoned to sit in parliament, the name of *barons by writ* was given to those who actually were so. The word baron was not known in the British Isles till introduced from the Continent under the Norman princes. The coronet of a baron of England consists of a plain gold circle, with six balls or large pearls on its edge, cap, &c., as in a viscount's.—2. Its first known application was to William the Conqueror, who was called William the Bastard before the Conquest, and, indeed, calls himself so—'Ego Wilhelmus cognomine *bastardus.*' Mahn and Littré derive it from O.Fr. *bast* (Fr. *bât*), a pack-saddle, with the common termination *-ard* added to it, referring to the old locution *fils de bast*, son of a pack-saddle, the muleteers being accustomed to use their saddles for beds in the inns. (Comp. G. *bankert*, a bastard, from *bank*, a bench.) The O.Fr. *bast* may have been so called because made of *bast.* Vigfusson (*Icelandic-English Dict.*), in speaking of the Icel. *bastardr*, suggests another origin:—'This word is, we believe, derived from *bâss*, a 'boose,' stall, Goth. *bansts;* its original sense would then be, one born in a stall or crib; hence, as a law term, a *bastard;* *hornungr*, from *horn* (a corner), is an analogous term, comp. Ger. *winkelkind* (corner-child), for in ancient Teutonic laws the bastard or outcast was considered as being born in an out-of-the-way place. . . . Literally *bastardr* means 'boose-hard,' the hardy one of the stall, the bastard being the boy who got all kinds of rough usage, and so became hardy.'] 1. A natural child; a child begotten and born out of wedlock; an illegitimate or spurious child. By the civil and canon laws, and by the law of Scotland, a bastard becomes a legitimate child by the intermarriage of the parents at any future time. But by the laws of England a child, to be legitimate, must at least be *born* after the lawful marriage; it does not require that the child shall be begotten in wedlock, but it is indispensable that it should be born after marriage, no matter how short the time, the law presuming it to be the child of the husband. The only incapacity of a bastard is that he cannot be heir, or next of kin, to any one save his own issue. In England the maintenance of a bastard in the first instance devolves on the mother, while in Scotland it is a joint burden upon both parents. Mercury, fusible metal, tin, or lead are employed for this purpose.—*Knights of the Bath*, an order of knighthood supposed to have been instituted at the coronation of Henry IV. in 1399. It received this name from the circumstance of the candidates for the honour being put into a bath the preceding evening, to denote a purification or absolution from their former misdeeds, and that they were now to commence a new life. The present order of the Bath, however, was instituted by George I. in 1725. It was a military order, and consisted, exclusive of the sovereign, of a grand-master and thirty-six companions. In 1815 the order was greatly extended, and in 1847 opened to civilians. The members, both military and civil, form three classes, viz., knights grand-crosses, G.C.B.; knights-commanders, K. C. B.; and companions, C.B.

That of the knights grand-crosses (fig. 2) is of silver, with eight points of rays wavy, on which is a gold cross bearing three crowns, encircled by a ribbon displaying the motto of the order, while beneath is a scroll inscribed *Ich dien*. The contest was held before the judges on a piece of ground inclosed, and the combatants were bound to fight till the stars appeared, unless the death or defeat of one party sooner decided the contest. The weapons used were batons or staves an ell long. Women, priests, men above sixty, and lame and blind persons might appear by champions. Though long fallen into desuetude, it was a valid and legal mode of trial in England down to 1818, and was then abolished in consequence of the defendant in a suit having demanded this mode of arbitrament, and its being found that it could not legally be denied him.

The opinion of the Rabbins, which Bockhart supports, is that *bedolach* signifies originally a pearl, and as a collective noun pearls, which may be compared to grains of manna —hence its secondary sense of a gum.] An aromatic gum resin brought chiefly from Africa and India, in pieces of different sizes and figures, externally of a dark reddish brown, internally clear, and not unlike glue. To the taste it is slightly bitterish and pungent; its odour is agreeable. In the mouth it becomes soft and sticks to the teeth; on a red-hot iron it readily catches flame, and burns with a crackling noise. It is used as a perfume and a medicine, being a weak deobstruent. Indian bdellium is the produce of *Balsamodendron Roxburghii;* African, of *B. africanum;* Egyptian bdellium is obtained from the doum palm (*Hyphæne thebaica*); and Sicilian is produced by *Daucus gummifer*, a species of the genus to which the carrot belongs.

Be (bē), *v.i. substantive verb*, pres. *am, art* (sometimes *beest*), *is, are* (sometimes *be*); pret. *was, were;* subj. *be;* imper. *be;* pp. *been;* ppr. *being*. [This is one of the three different verbal roots that are required in the conjugation of the substantive verb, the others being *am* and *was*. In English, unless in compound tenses, it is now almost confined to the subjunctive, imperative, infinitive, and participles, but in Anglo-Saxon, Old English, and up even to the time of Milton, it was conjugated in the present indicative, singular and plural, nor is the present quite obsolete in written English yet, being also common in the dialects. In A. Sax. it was in the pres. *beó* or *beom, bist, bith*, pl. *beóth;* subj. *beó*, pl. *beón;* imper. *beó*, pl. *beóth;* inf. *beón;* in later times we find *beth* and *bes* in the third person singular, and *ben* (sometimes *bin*) in the plural. The root *be* is seen in O.Sax. *bium*, O.H.G. *pim*, G. *bin*, I am, and is allied to A. Sax. *búan*, to dwell, L. *fui*, I was, *futurus*, about to be, future, Skr. *bhú*, to be. See AM and WAS.] 1. To have a real state or existence; to exist in the world of fact, whether physical or mental.

Time *was*, Time *is*, and Time shall *be* no more. *Southey.*

To *be*, or not to *be*, that is the question. *Shak.*

2. It asserts connection merely between a subject and predicate without necessarily involving a predicate in itself: (*a*) Connection of identity; as, John *is* the man. (*b*) Connection of relation—(1) Between a characteristic or permanent attribute and a subject; as, John *is* a man; John *is* mortal; John *is* brave. (2) Between an accidental quality, state, or condition, and the subject; as, John *is* hungry; things *are* so. *Be* is often thus used, especially in negative sentences, with a clause introduced by *that* for the predicate, in the same sense as is expressed by such phrases as: *it is (not) the case; it is (not) because.* '*Were* it *not that* I have bad dreams.' *Shak.*

And yet it *is not that* I bear thee love;
But since that thou canst talk of love so well,
Thy company, which erst was irksome to me,
I will endure. *Shak.*

(3) Connection of place-relation; as, John *is* at home; he *was* in town yesterday.—3. Used before a personal noun, or pronoun, or noun personified, with the prepositions *to, with*, &c., before the latter, in the sense which the Latin verb *est* has before a personal dative; as, *est mihi liber* (a book is to me, *i.e.* I have a book); that is, indicating possession on the part of the person.

Half all Cominius' honours *are to* Marcius. *Shak.*

This mode of speech is, however, most frequently employed to express a salutation, wish, or the like. 'Peace *be to* the brethren.' Eph. vi. 23.—4. In addition to its use as an independent verb, *be* (and its conjugational forms) is employed as an auxiliary in forming the tenses of other verbs. It is so used (*a*) in forming the passive voice of transitive verbs; as, he *is* or *has been* disturbed. In such passive forms (of modern origin) as *is being written, was being written*, which express an uncompleted action, *being* has the sense of *becoming*. (*b*) It is used in forming the perfect and pluperfect tenses of many intransitive verbs expressing a change of place or condition, where the use of this auxiliary instead of *have* shows that what is looked to is rather the result of the action or process expressed by the verb than the action or process itself. This mode of construction was formerly much more common than it is now, but it is not by any means obsolete. Among the verbs so construed are such as go, come, ride, flee, fly, steal away, rise, sink, fall, &c.; become, grow, turn, chance, escape, perish, fade, cease, vanish.

The heathen *are perished* out of his land (that is, have perished and now no longer exist in his land). Ps. x. 16.

Sometimes even the perfect and pluperfect of the verb *to be* are construed with a participle of such an intransitive verb.

The invalid . . . moaned out a feeble complaint that the girl *had been gone* an hour. *Dickens.*

It forms, with the infinitive, a particular future tense, which often expresses duty, necessity, or purpose; as, government *is to be* supported; we *are* to pay our just debts. Where it is used only with its own infinitive it often expresses mere futurity, as in the colloquial expression *that is to be* for *future*. 'My wife *that is to be*.' *Dickens.*—*Been and*, a common vulgarism introduced pleonastically into the perfect and pluperfect tenses of other verbs: often extended to *been and gone and*.

Sir Pitt has *been and* proposed for to marry Miss Sharp. *Thackeray.*

—*Let be*, to omit or leave untouched; to let alone.

Let be, said he, my prey. *Dryden.*

[It has been thought better to exhibit the uses of the verb in its various forms (*am, are, is, was, were*, &c.) here rather than in fragmentary details at each individual form.]

Be- (bē), a prefix common to the Teutonic languages, the same word as *by*. It has various uses. (*a*) It changes substantives and adjectives into verbs; as, *befriend, benight, becalm, belittle*. (*b*) It changes intransitive verbs into transitive, sometimes modifying the root-meaning of the simple verb; as, *bespeak, bethink, beseem, bequeath*. (*c*) It modifies also the root-meaning of certain transitive verbs; as, *behold, beseech, befit*. (*d*) It adds an intensive force to certain transitive verbs, without modifying their root-meaning; as, *bedaub, bepraise, besmear*. (*e*) It changes the indirect object of the simple verb into the direct, and *vice versâ;* thus, I *strew* the roses on the ground, but I *bestrew* the ground with roses; I *sprinkle* water on a dress, but I *besprinkle* a dress with water. (*f*) It is the prefix of certain participles or participial adjectives, which have no finite tenses, or whose finite tenses are very rarely used; as, *beloved, betroubled, bemused*. (*g*) It enters into the composition of certain nouns substantive; as, *behest, behalf, behoof*. (*h*) It changes certain nouns into adverbs and prepositions; as, *because, before, below, beside, besides*. (*i*) It represents other Anglo-Saxon prefixes; as, *believe* = A.Sax. *gelyfan*, G. *glauben*. [Though a pure Anglo-Saxon prefix, it is frequently conjoined with Romance stems: comp. in addition to several of the above, the verbs *becharm, besiege, betray*.]

Comp. *kirk, church; birk, birch*, &c.] The shore of the sea or of a lake, which is washed by the tide and waves; the strand. It may be sometimes used for the shore of large rivers.—*Raised beaches*, in *geol.* a term applied to those long terraced level pieces of land, consisting of sand and gravel, and containing marine shells, now, it may be, a considerable distance above and away from the sea, but bearing sufficient evidences of having been at one time sea-beaches. Bead (bēd), *n.* [A.Sax. *bed, bead*, a prayer, from *biddan*, to pray. Beads are used by Roman Catholics to keep them right as to the number of their prayers, one bead of their rosary being dropped every time a prayer is said; hence the transference of the name from that which is counted (the prayers) to that which is used to count them. So in Sp. and Pg. *cuenta, conta*, a bead, is from *contar*, to count. The old phrase *to bid one's beads* means to say one's prayers. See BID.] 1.† A prayer. 'Saying over a number of *beads*, not understanded or minded on.' *Injunctions to the Clergy*, 1541.—2. A little perforated ball of gold, pearl, amber, glass, or the like, to be strung on a thread, the string thus formed being either worn round the neck as an ornament, and called a necklace, or used, under the name of a rosary, by Roman Catholics in numbering their prayers, one bead being passed at the end of each ejaculation or short prayer; hence the phrase to *tell one's beads*, literally to number one's prayers, but used simply in the sense of to say one's prayers.

In *arch.* and *joinery*, a small round moulding sometimes cut into short embossments, like pearls in a necklace; an astragal. In winter they live in houses, which are 3 to 4 feet high, are built on the water's edge, and afford them protection from wolves and other wild animals. There are several varieties, as *C. nigra*, or black beaver, *C. alba*, or white beaver, and *C. varia*, or spotted beaver.—2. The fur of the beaver.—3. A hat made of beaver-fur. The species are numerous, the honey-bee being the most interesting to man. It has been kept in hives from the earliest periods for its wax and honey. It lives in swarms or societies of from 10,000 to 50,000 individuals. These swarms contain three classes of bees—the females or queen bees, the males or drones, and the imperfect or undeveloped females, called *neuters*, constituting the working bees. In each hive or swarm there is only one female or queen, whose sole office is to propagate the species. It is much larger than the other bees. When a queen dies a young working bee three days old is selected, its cell is enlarged by the partitions being broken down, its food changed to royal jelly or paste, and it grows into a queen. The queen lays 2000 eggs a day, or 100,000 a year. The drones serve merely for impregnating the queen, after which they are destroyed by the neuters. These last are the labourers of the hive. They collect the honey, form the cells, and feed the other bees and the young. They are furnished with a proboscis by which they suck the honey from flowers, and a mouth by which they swallow it, and then convey it to the hive in their stomachs, whence they disgorge it into the cells. The pollen of flowers settles on the hairs with which their body is covered, whence it is collected into pellets by a brush on their second pair of legs, and deposited in a hollow in the third pair. It is called *bee-bread*, and is the food of the larvæ or young. The adult bees feed on honey. The wax was at one time supposed to be formed from pollen by a digestive process, but it is now ascertained that it is formed by secretion from the honey. The females and neuters have a barbed sting attached to a bag of poison, which flows into the wound inflicted by the sting. When a hive becomes overstocked a new colony is sent out under the direction of a queen bee. This is called *swarming*. Besides the common bee (*A. mellifica*) there are the *A. fascicata*, domesticated in Egypt; the *A. ligustica*, or Ligurian bee of Italy and Greece, introduced into England; the *A. unicolor* of Madagascar, the *A. indica*, &c.—2. The root meaning of the word is seen in Gr. *phagein*, Skr. *bhag*, to eat, the tree originally receiving its name from its nuts being eaten by the early tribes. *Book* is identical with this word, being so called from the use of beechen boards or beech bark for writing on in early times. See BOOK.] A tree of the genus Fagus, nat. order Cupuliferæ. The common or European beech (*F. sylvatica*) grows to a large size, with branches forming a beautiful head with thick foliage. The bark is smooth and of a silvery cast. The mast or nuts are eaten by swine, poultry, oxen, and other animals, and yield a good oil for lamps. Beech is not much used in building, as it soon rots in damp places, but it is used as piles in places where it is constantly wet. It is manufactured into a great variety of tools, for which it is fitted on account of its great hardness and uniform texture, and is also extensively used in making furniture. G. *friede* (peace) has this meaning only in compounds). A false etymology (the word being connected with *bell* partly through the O.Fr. forms containing *l*) has confined the English word to a chamber, tower, or erection in which bells are hung.] 1. In *milit. antig.* (*a*) a great wooden tower erected by besiegers to the height of the walls of a place to be assailed. It consisted of several stages, was mounted on wheels, and was often covered with raw hides to protect those under it from fire, boiling oil, and the like. The lowermost story had sometimes a battering-ram, the stories intermediate between it and the uppermost were filled with bowmen, arbalestiers, &c., to gall the defenders, while the uppermost was furnished with a drawbridge to let down on the wall, over which the storming party rushed to the assault. (*b*) A stationary tower near a fortified place, in which were placed sentinels to watch the surrounding country, and give notice of the approach of an enemy. It was furnished with a bell to give the alarm to the garrison, and also to summon the vassals of a feudal lord to the defence. This fact helped the belief that the word was connected with *bell*.—2. A bell-tower, generally attached to a church or other building, but sometimes standing separate.—3. That part of a steeple or other building in which a bell is hung, and more particularly the timber work which sustains it.—4. *Naut.* the ornamental frame usually fixed on the top of the pawlbit, in which the ship's bell is hung.

Belief (bē-lēf'), *n.* [See BELIEVE.] 1. A persuasion of the truth, or an assent of the mind to the truth of a declaration, proposition, or alleged fact, on the ground of evidence, distinct from personal knowledge; conviction founded on evidence which may be fitted to produce the strongest feeling of confidence in one's own mind, but which would not necessarily produce the same confidence in other people's minds. When we use the word *belief* there is always an under-reference to the possibility of doubt, whereas in using the word *knowledge* there is no such under-reference, or rather every suggestion of that sort is positively excluded. We speak of *knowing*, not *believing*, what we actually observe; and if such a phrase as '*belief* of the senses' is used it is only when in a metaphysical discussion the question of doubting the evidence of the senses has been raised.

This word is often followed by *in*, with the sense of to hold as the object of faith, to have belief of, to confide in; as, I *believe in* the truth of that assertion. 'Ye *believe in* God, *believe* also *in* me.' Jn. xiv. 1. In the Scriptures, and in theological literature generally, the word is also frequently followed by *on*, with a personal object, or what is equivalent to one.

With the view of getting entirely rid of these impurities, which injure the steel, the process has to be continued till all the carbon also is removed, when a proper proportion of it is re-introduced by re-melting the pure metal with spiegeleisen, or some other variety of iron, rich in carbon and containing no admixture besides. If malleable iron is wanted no carbon is re-introduced.

The most obvious use of the bile in the animal economy is to separate the chyle from the chyme. It appears also to aid in exciting the peristaltic action of the intestines. The natural colour of the fæces seems to be owing to the presence of bile. The chemical composition varies with the animal which yields it, but every kind contains two essential constituents, a resinous matter and a colouring matter called cholochrome, associated with small quantities of cholesterine, fats, salts of fatty acids, and certain mineral salts, chiefly chloride of sodium and phosphates. The greater part of the bile returns into the blood, the resinoid and colouring matters and cholesterine being the principal excrementitious substances.—2. 2. A prelate or person consecrated for the spiritual government and direction of a diocese. In England bishops are nominated by the sovereign, who, upon request of the dean and chapter for leave to elect a bishop, sends a *congé d'élire*, or license to elect, with a letter missive, nominating the person whom he would have chosen. The election, by the chapter, must be made within twelve days, or the sovereign has a right to appoint whom he pleases. Most of the bishops are peers of the realm. A bishop, as well as an archbishop, has his consistory court to hear ecclesiastical causes, and makes visits to the clergy, &c. He consecrates churches, ordains, admits, and institutes priests; confirms, suspends, excommunicates, grants licenses for marriage, makes probates of wills, &c.; and may grant leases for three lives, or twenty-one years, of lands usually let, reserving the accustomed yearly rents. He has his archdeacon, dean, and chapter, chancellor, and vicar-general to assist him. —*Bishops in partibus* (*infidelium*), in the *R. Cath. Such titles are given for instance to missionary bishops in countries imperfectly Christianized, and were formerly given to the Roman Catholic bishops in Britain, the bishop of the northern district of Scotland up to 1878 having the title of Bishop of Nicopolis. The assumption by Roman Catholic bishops of titles borrowed from towns or districts in England gave rise in 1850 to the Ecclesiastical Titles Bill (14 and 15 Vict. cap. lx.), prohibiting the constitution of pretended provinces under a penalty of £100; but this act has been allowed to remain a dead-letter.—3. It is often found in a native state, crystallized in rhombs or octahedrons, or in the form of dendrites, or thin laminæ investing the ores of other metals, particularly cobalt. Bismuth is used in the composition of pewter, in the fabrication of printers' types, and in various other metallic mixtures. The similar tools used for metal, and applied by the drill-bow, ratchet, brace, lathe, or drilling-machine, are termed *drills* or *drill-bits.* The variety is very great. For wood the typical form is the *shell-bit* (fig. *a*), which is shaped like a gouge, for shearing the fibres round the circumference of the hole. When large, it is termed a *gouge-bit*, and when small a *quill-bit.* Sometimes the piercing end is drawn to a radial point, and it is then known as the *spoon-bit.* Occasionally the end is bent into a semicircular form horizontally, and it then becomes the *duck-nose bit.* The *centre-bit* (fig. *b*) is another typical form, of which there are many modifications. The end is flat, and provided with a centre-point or *pin*, filed triangularly, and which serves as a guide for position, a shearing edge or *nicker* serving to cut the fibres round the margin of the hole, and a broad chisel-edge or cutter to pare away and remove the wood within the circle defined by the nicker. This air-blast, which is propelled by a powerful blowing-engine, and is now invariably heated to a high temperature (600° to 900° F.), is injected by tuyeres, situated as shown at A in the annexed vertical section, in the lowest part of the furnace, near to the hearth B. (See TUYERE.) The conical part C next above the hearth is termed the boshes, and the interior is continued upwards, sometimes, as in the annexed cut, in a tapered body or cone D, sometimes as a perpendicular cylinder, which is surmounted by an opening for the introduction of the materials from an external gallery F. The exterior consists of massive masonry of stone or fire-brick, the body part being lined with two

shells of fire-bricks separated by a thin space to allow for expansion, which is generally filled with sand, ground fire-clay, or the like, to hinder the radiation of heat to the outside. When the body rises in the form of a perpendicular cylinder, it is called the barrel. The cone or barrel is sometimes clasped round on the outside by numerous strong iron hoops, or is cased with iron plates fastened to the masonry by iron bolts. The boshes C are lined with fire-brick or fire-stone, and the hearth B is built with large blocks of refractory stone. The charging of the furnace goes on all day and night, one charge consisting of a barrow-load of coal and a barrow-load of ore, char, and lime, the last mineral acting as a flux. These charges are constantly passing downwards and undergoing a change as they come nearer the hotter parts of the furnace. Towards the lower part the earthy matter of the ore unites with the limestone and forms a slag, which finally escapes at an opening below the tuyeres, and the molten metal drops down and fills the lower part at B, to be drawn off at stated periods. This is done usually twice in the twenty-four hours by means of a round hole called a tap. The furnace is constantly kept filled to within about 2 feet of the top. The ore put in at the top takes about thirty-six hours before it comes out as iron. Hematite yields on an average about 55 per cent. of metal, and blackband about 40 to 50. In the newer forms of furnaces the top is closed and the gases formerly burned at the top are conveyed by pipes G to be utilized as fuel in heating the blast and in raising steam for the blowing-engine. The principle adopted is to close the top by a bell-and-cone arrangement E, which is opened and shut at pleasure by hydraulic or other machinery. The height of furnaces varies from 50 to 80, and even in some cases to upwards of 100 feet, and the greatest width is about one-third of this.

Sw. *blod*, L.G. *blood*, D. *bloed*, G. *blut*; root probably seen in to *blow, bloom*, G. *blühen*, to blow or glow, *blume*, a flower, from the brightness of its colour.] 1. The fluid which circulates through the arteries and veins of the human body and that of other animals, which is essential to the preservation of life and nutrition of the tissues. This fluid is more or less red in vertebrates, except in the lowest fishes, colourless in insects, and in others of the lower animals red, bluish, greenish, or milky. The venous blood of mammals is a dark red, but in passing through the lungs it becomes oxidized and acquires a bright scarlet colour, so that the blood in the arteries is of a brighter hue than that in the veins. The specific gravity of human blood varies from 1·045 to 1·075, and its normal temperature is 99° Fahr. 1000 parts contain 783·37 of water, 2·83 fibrin, 67·25 albumen, 126·31 blood corpuscles, 5·16 fatty matters, 15·08 various animal matters and salts.—*Blood corpuscles* or *globules*, red and white bodies floating in the serum of blood. The red ones give colour to the blood, and are flat discs, oval in birds and reptiles, and round in man and most mammals. In man they average $\frac{1}{3200}$th inch in diameter, and in the Proteus, which has them larger than any other vertebrate, $\frac{1}{405}$th inch in length and $\frac{1}{717}$th in breadth. The white or colourless corpuscles are the same as the lymph or chyle corpuscles, and are spherical or lenticular, nucleated, and granulated, and rather larger than the red globules. The colour of the red corpuscles is due to globulin and hematin. From being popularly regarded as the fluid in which more especially the life resides, as the seat of feelings, passions, hereditary qualities, &c., the word has come to be used typically, or with certain associated ideas in a number of different ways. Thus—(*a*) One who inherits the blood of another; child; offspring; progeny: sometimes *flesh and blood* is used in this sense; as, we should prefer our own *flesh and blood* to strangers.

(*c*) Birth; extraction; absolutely, high birth; good extraction: often qualified by such adjectives as *good, base*, &c. 'A prince of *blood*, a son of Priam.' *Shak.* In this sense the word is often used of the pedigree of horses; hence, a *bit of blood*, an animal of good pedigree, a well bred animal.

—*The blood*, the royal family or royal lineage; thus it is common to speak of princes of *the blood*. (*d*) Blood that is shed; bloodshed; slaughter; murder.

(*f*) Temper of mind; natural disposition; high spirit; mettle; passion; anger: in this sense often accompanied with *cold* or *warm*, or other qualifying word. Thus, to commit an act in *cold blood* is to do it deliberately and without sudden passion. *Hot* or *warm blood* denotes a temper inflamed or irritated; to *warm* or *heat the blood* is to excite the passions. In its simplest form it is merely a conical tube of brass, glass, or other substance, usually 7 inches long and ⅛ inch in diameter at one end, and tapering

so as to have a very small aperture at the other, within 2 inches or so of which it is bent nearly to a right angle, so that the stream of air may be directed sideways to the operator. The blow-pipe represented is somewhat more complicated, being furnished with a hollow ball for condensing the vapour of the breath, which is apt to prove injurious in the common form. It may be provided with several movable nozzles to produce flames of different sizes. The current of air is often formed by a pair of bellows instead of the human breath, the instrument being fixed in a proper frame for the purpose. The most powerful blow-pipe is the oxyhydrogen or compound blow-pipe, an instrument in which oxygen and hydrogen (in the proportions necessary to form water), propelled by hydrostatic or other pressure, and coming from separate reservoirs, are made to form a united current in a capillary orifice at the moment when they are kindled. The heat produced is such as to consume the diamond and to dissipate in vapour or in gaseous forms most known substances. The blow-pipe is used by goldsmiths and jewellers in soldering, by glass-blowers in sealing the ends of tubes, &c., and extensively by chemists and mineralogists in testing the nature and composition of substances.—2. Though destitute of fangs and venom, the boas are endowed with a degree of muscular power which renders them terrible. Once fairly involved in the crushing folds of these serpents, the strength of the most powerful man would not prove of the slightest avail. They seize sheep, deer, &c., and crush them in their folds, after which they swallow the animal whole. The species of boa are peculiar to the hot parts of South America. The *Boa constrictor* is not one of the largest members of the genus, but the name boa or boa constrictor is often given popularly to any of the large serpents of similar habits, and so as to include the Pythons of the Old World and the Anaconda of America.—2. A strong metallic vessel, usually of wrought-iron plates riveted together, in which steam is generated for driving engines or other purposes. A steam-boiler generally consists of a fire-box, in which the combustion of the fuel occurs, and flues, through which the products of combustion pass into the chimney, together with a space containing the water and steam, the whole contained in an outer shell. Among principal varieties of boilers are—the *cylinder boiler*, consisting of a single iron shell; the *return-flue boiler*, containing flues through which heated gases return through the water-space to the chimney, and sometimes containing a fire-box inclosed by water; the *multiflue* or *locomotive boiler*, which consists of an inclosed fire-box and a large number of small flues leading to the chimney; and the *water-tube boiler*, which consists of an inclosed fire-box and a fire-chamber filled with small tubes through which the water circulates.—*Tubular boiler*, a multiflue or multitubular boiler, in distinction from a boiler with large flues.

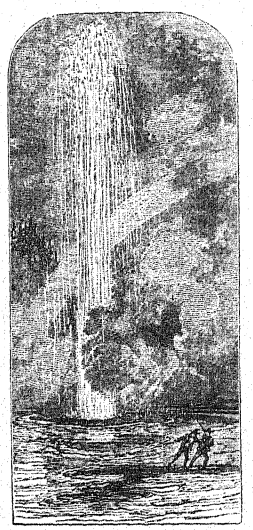
Pertaining to a state of ebullition.—*Boiling point*, the degree of heat at which a fluid is converted into vapour with ebullition. This point varies for different liquids, and for the same liquid at different atmospheric pressures, being higher when the pressure of the atmosphere is increased, and lower when it is diminished. When the barometer stands at 30 inches water boils at 212° of Fahr. (100° Centigrade, 80° Réaumur), and it is found that the boiling point varies 0·88 of a degree for every half-inch of variation of the barometer, and consequently every tenth of an inch which the barometer rises or falls alters the boiling point of water 0·176 of a degree of Fahr. Hence water will boil at a lower temperature, owing to diminution in the pressure, at the top of a mountain than at the bottom, and this leads us to a method of measuring the height of mountains. Water boils in vacuo at 98° of Fahr. Under additional pressure it may be raised to 400° Fahr. without boiling. Mercury boils at 662°, and hydrochloric ether at 52°, when the barometer stands at 30 inches.—*Boiling springs*, springs or fountains which give out water at the boiling point or at a high temperature. For long the geysers of Iceland were regarded as the most remarkable boiling springs, but these are far surpassed by those discovered in the Yellowstone Region, in the territories



The Grand Geyser in Yellowstone Region, United States.

Bone (bōn), *n.* [A. Sax. *bán*, a bone; cog. D. and Dan. *been*, Icel. and G. *bein*, a bone, the lower part of the leg.] 1. An integral portion of the skeleton of an animal; the substance of which the skeleton of vertebrate animals is composed; a firm hard substance of a dull white colour, composing the framework that supports the soft parts of the body. Bones give shape to the body, defend the viscera, and act as levers to the muscles. The texture varies in different bones, and in different parts of the same bone. The long bones, such as those of the arm or leg, are compact in their middle portion, and cellular or spongy at the extremities, which also have a larger diameter. They have a longitudinal cavity (the medullary canal) throughout their length containing the marrow. The flat bones are compact externally, and cellular or cancellated internally. They have no medullary canal, though their substance contains marrow. The bones in a fœtus are soft and cartilaginous, but they gradually harden with age. Bones are supplied with blood-vessels, and in the fœtus, or in a diseased state, are very vascular. They are also furnished with nerves and probably with absorbents. They are covered with a thin, strong membrane, called the periosteum, which, together with the bones, has very little sensibility in a sound state, but when inflamed is extremely sensitive. Bones consist of earthy or saline matters, 66·7 per cent., and animal matter, almost wholly gelatine, 33·3 per cent. The earthy matter gives them their solidity, and consists of phosphate of lime, with a small portion of carbonate of lime and phosphate of magnesia. Bones of cattle and other animals are extensively used in the arts in forming handles for knives, and for various other purposes. They are also employed as a manure for dry soils, with the very best effect, being ground to dust, bruised, or broken into small fragments in mills, or dissolved in sulphuric acid. The great utility of bones as a manure consists in the phosphate of lime they supply to the soil.—2. A sort of bobbin made of a trotter-bone, for weaving lace.—3. *pl.* Dice. [Slang or colloq.]

Properly kept books must show what a person has, what he owes, and what is owing to him, as well as what sums he has received and paid, what losses he has incurred, &c. Books are kept according to one of two chief methods, book-keeping by *single* and book-keeping by *double entry.* The former is more simple and less perfect than the latter, and is now chiefly used in retail businesses only. The only book essential to it is a ledger, containing accounts under the names of the parties with whom the trader deals, debts incurred being entered to the credit of the party to whom they are owing, debts due to the trader being entered in like manner to the debit of the party owing them, and each entry appearing only once on one side or other of an account. Book-keeping by double entry, which originated in Italy, is more complicated, but gives a much more full and accurate account of the historical details of a business. The essential feature of the system consists in adopting, in addition to the personal accounts of debtors and creditors in the ledger, a series of what are called *book-accounts,* which are systematic records of particular classes of transactions in the form of accounts having both a debtor and a creditor side. These book-accounts are based on the principle that all money and articles received become debtors to him from whom or that for which they are received, and, on the other hand, all those who receive money or goods from us become debtors to cash or to the goods. In this way every transaction is entered in the ledger on the creditor side of one account and on the debtor side of another. The books used in double entry vary in number and arrangement according to the nature of the business and the manner of recording the facts. Transactions as they take place from day to day are generally recorded in such books as the stock-book, cash-book, bill-book, invoice-book, sales-book, or they may all be recorded in order in a waste-book or day-book. Upon these books or additional documents are based the journal and ledger. The former contains a periodical abstract of all the transactions recorded in the subordinate books or in documents not entered in these, classified into debits and credits, while the latter contains an abstract of all the entries made in the former, classified under the heads of their respective accounts.

Book-maker (bụk'māk-ėr), *n.* 1. One who writes and publishes books; especially, a compiler.—2. One who makes a 'book,' as it is called, on a race; a professional better or layer of the odds. See following extract.

In betting there are two parties—one called 'layers,' as the *book-makers* are termed, and the others 'backers,' in which class may be included owners of horses as well as the public. The backer takes the odds which the *book-maker* lays against a horse, the former speculating upon the success of the animal, the latter upon its defeat; and taking the case of Cremorne for the Derby of 1872, just before the race, the *book-maker* would have laid 3 to 1, or perhaps £1000 to £300 against him, by which transaction, if the horse won, as he did, the backer would win £1000 for risking £300, and the *book-maker* lose the £1000 which he risked to win the smaller sum. At first sight this may appear an act of very questionable policy on the part of the *book-maker;* but really it is not so, because so far from running a greater risk than the backer, he runs less, inasmuch as it is his plan to lay the same amount (£1000) against every horse in the race, and as there can be but one winner, he would in all probability receive more than enough money from the many losers to pay the stated sum of £1000 which the chances are he has laid against the one winner, whichever it is. *Eng. Ency.*

Botany (bot'a-ni), *n.* [As if from a form *botaneia*, from Gr. *botanē*, herbage, a plant, from *boskō*, to feed.] The science which treats of the vegetable kingdom, dealing with the forms of plants, their structure, the nature of the tissues of which they are composed, the study of living plants and of the vital phenomena connected with them, the arrangement of plants into larger and smaller groups, according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at former epochs lived on the world, as well as the distribution of plants on the face of the earth at the present time. It is thus divided into several sections:—*Structural* or *morphological botany*, that branch of the science of botany which relates to the laws of vegetable structure or organization, internal or external, independently of the presence of a vital principle. It is also called *Organography.*—*Physiological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, their changes in health or disease, &c.—*Descriptive botany*, that branch which relates to the description and nomenclature of plants. It is also called *Phytography.*—*Systematic botany*, that branch which relates to the principles upon which plants are connected with and distinguished from each other. The system of classification now universally adopted is that proposed by Jussieu and improved and enlarged by De Candolle, Brown, and others. It is generally called the natural system, because it is intended to express, as far as we are able, the various degrees of relationships among plants as these exist in nature, and to group the various species, genera, and orders next to each other which are most alike in all respects. Several artificial systems have been proposed, as that of Tournefort, based on the leaves of the flower; but the best known is that of Linnæus, founded on the stamens and pistils. This system, which Linnæus himself meant to be only temporary, proved of great value to the science of botany, but it has now gone entirely out of use, or is used only as a partial index to the vegetable kingdom.—*Botanical geography*, or the plan of distribution of plants over the globe, with an inquiry into the causes which have influenced or maintain this distribution.—*Palæontological* or *fossil botany* embraces the study of the forms and structures of the plants found in a fossil state in the various strata of which the earth is composed.

Both (bōth), *a.* and *pron.* [One of the Scandinavian words in English; Icel. *báthir*, *bœthi*, Sc. *baith*, Dan. *baade*, Goth. *bajoths*, G. *beide*, both. The first element in the word is seen in A. Sax. *bá*, *bátwá*, both-two, both, Goth. *bai*, both, and in L. *ambo*, G. *amphō*, Skr. *ubha*, both; the *th* seems to be a mere suffix.] The one and the other; as, here are two books, take them *both*; the two; the pair or the couple. In such a sentence as '*both* men were there,' it is an adjective; in 'he invited James and John, and *both* went,' it is a pronoun; also in 'the men *both* went,' 'he took them *both*,' it is a pronoun in apposition to *men*, *them*: in the same way it may be explained in '*both* the men,' '*both* of the men' (comp. 'the city of Rome').

It often stands for two statements or clauses of a sentence, as in the following extract.

It is often used as a conjunction in connection with *and*—*both* . . . *and* being equivalent to as well the one as the other; not only this but also that; equally the former and the latter. 'Power to judge *both* quick *and* dead.' *Milton.*

A great multitude *both* of the Jews *and* also of the Greeks believed. Acts xiv. 1.

figure with four heads and four arms, and he is frequently attended by his vehicle the goose or swan. Brahmā has long since ceased to occupy the high place he once held among the gods of India, and is seldom if at all worshipped, as, since the creation of the world, he has ceased to have any functions to perform. It will not be till the tenth *avatar* or incarnation (when the world will undergo total annihilation) that his services will be again put into requisition.

Brahman (brä'man), *n.* Among the Hindus one of the sacred or sacerdotal caste, who claim to have proceeded from the mouth of Brahmā, the seat of wisdom, and to be the sole depositaries and interpreters of the Vedas. There are seven subdivisions of this caste, originating with seven penitents of high antiquity. Theoretically the Brahmans venerated equally the three gods or persons of the Hindu trimurti or trinity, but, practically, the worship of Brahmā having fallen into desuetude, they are divided into two sects—the devotees of Vishnu and those of Siva, the former wearing an orange-coloured dress with the *nama*, or mark of the trident of Vishnu on the forehead, the latter being distinguished by the *lingam*, or emblem of the male organ of generation, and affecting greater abstemiousness. The Brahman passes through four states. He enters on the first stage at seven years of age. In it he learns to read and write, studies the Vedas, and makes himself familiar with the privileges of his caste, as his right to ask alms and to be exempted from taxes, as well as from corporal and capital punishment. The second state begins with his marriage, when regular ablutions, fasting, and many minute observances become incumbent upon him. In the third he retires to the forest, feeds upon herbs, roots, and fruits, bathes morning, noon, and evening, and subjects himself to the most rigorous penance. In the fourth state, which is that of penance, he suppresses his breath, stands upon his head, and performs other like painful ceremonies till he rises to a participation of the divine nature. Called also *Brahmin.*

Brain (brān), *n.* [A. Sax. *brægen, bregen*. D. and O.Fris. *brein*.] 1. That soft whitish mass, or viscus, inclosed in the cranium or skull in man and other vertebrate animals, forming the centre of the nervous system, and the seat of consciousness and volition. In it the nerves and spinal marrow terminate. It is divided above into a right and left hemisphere, and below into six lobes. It is composed of a *cortical* substance, which is external, and a *medullary*, which is internal. From the brain proceed twelve pairs of nerves, which are distributed principally to the head and neck. That portion which occupies the superior part of the cavity of the cranium is termed the *cerebrum*, or brain proper; that which occupies the lower back part the *cerebellum*, or lesser brain; and that which lies at the base of the cranium beneath the cerebrum and cerebellum, and which is the smallest portion, the *medulla oblongata*, this being the upper portion of the *spinal cord* or *spinal marrow*. At the upper part of the medulla oblongata is an eminence or convex projection surrounding the peduncles of the cerebrum and cerebellum, and covering the expansion of the spinal bulb towards these peduncles like a bridge. This projection, called *Pons Varolii*, from its having been

first described by Varolius, is the centre of convergence or emergence of the nervous fascicles or bundles which it seems to cover. The brain is covered by three membranes; the external membrane is termed the *dura mater*, the middle one the *arachnoid membrane*, and the innermost the *pia mater*. According to Vauquelin the human brain contains 80 parts water, 7 albumen, 4·53 white fatty matter, 0·70 red fatty matter, 1·12 osmazome, 1·5 phosphorus; acids, salts, and sulphur, 5·15. Later chemists have detected a large proportion of cholesterine in the brain, and from 2 to 2·5 per cent. phosphorus. The human brain constitutes about $\frac{1}{35}$th of the weight of the body, in dogs it is $\frac{1}{120}$th, in the horse $\frac{1}{400}$th, in the sheep $\frac{1}{200}$th, and in the ox $\frac{1}{1000}$th part. In the embryo the brain is a hollow vesicle, the walls of which thicken irregularly but symmetrically on each side of the middle line, so that the cavity becomes reduced to the complex series of fissures and canals which mark its adult state.—2.
